

Another version of the Earthquake Machine

fault segmentation and interaction

North Anatolian Transform Fault - Turkey

Comparison of the North Anatolian and San Andreas Faults

A series of seemingly triggered earthquakes on the North Anatolian Transform Fault.

- Historical earthquake epicenter and magnitude
- 1957 Extent of surface rupture
- ↔ Directions of relative motion on fault

How the Coulomb Stress Change is Calculated

Stress ■ Rise ■ Drop

Shear stress
change

$$\Delta\tau_s$$

+

Friction coefficient \times
normal stress change

+

$$\mu' (\Delta\sigma_n)$$

=

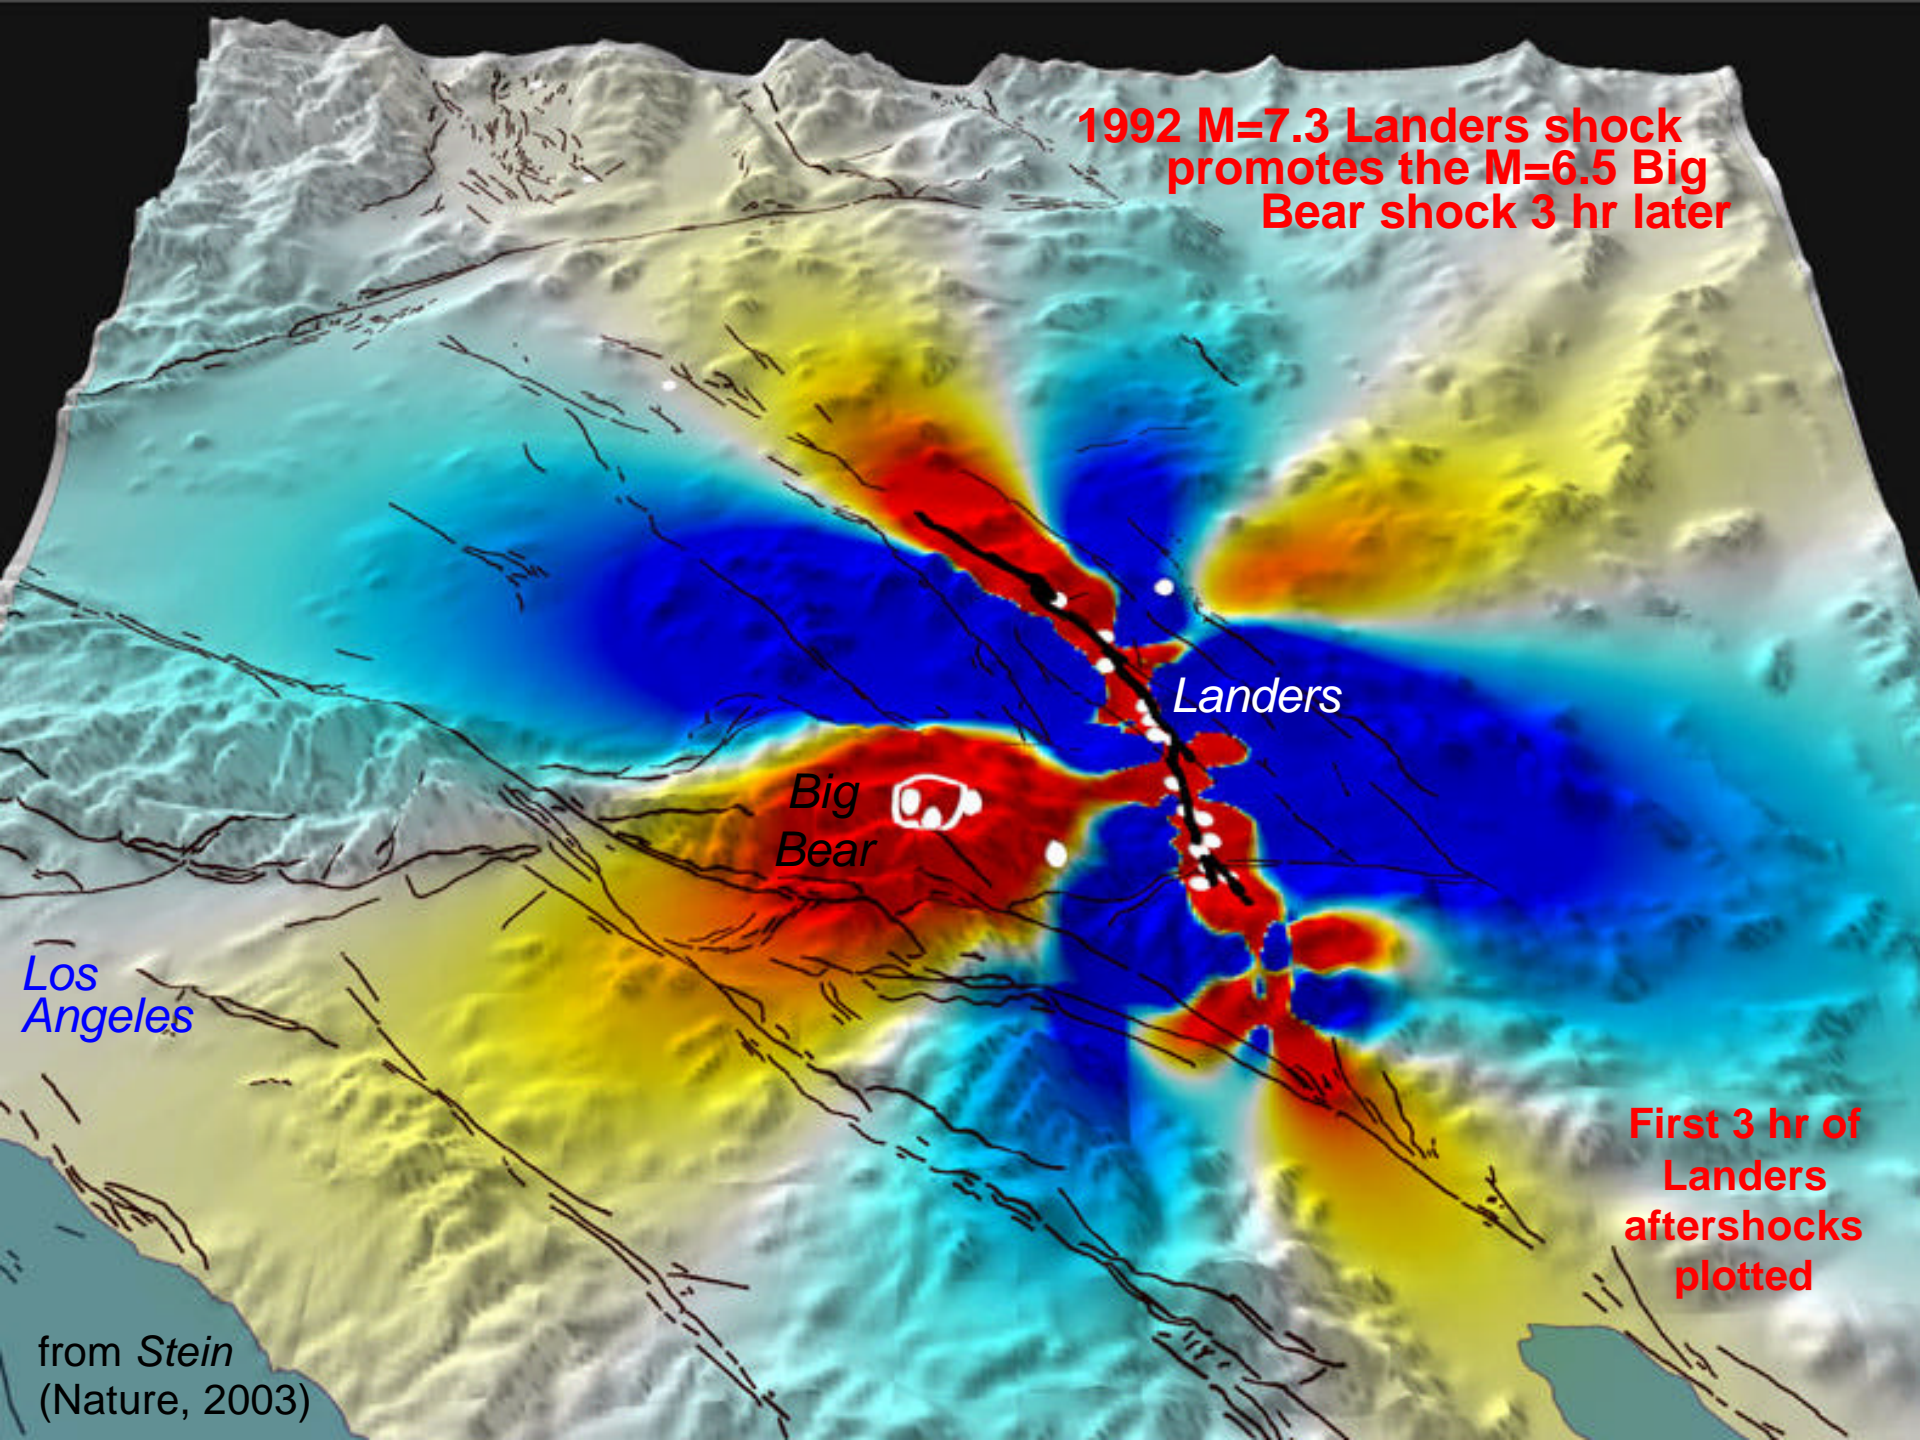

Coulomb failure
stress change

=

$$\Delta\sigma_f$$

- Example calculation for faults parallel to master fault

1992 M=7.3 Landers shock
promotes the M=6.5 Big
Bear shock 3 hr later

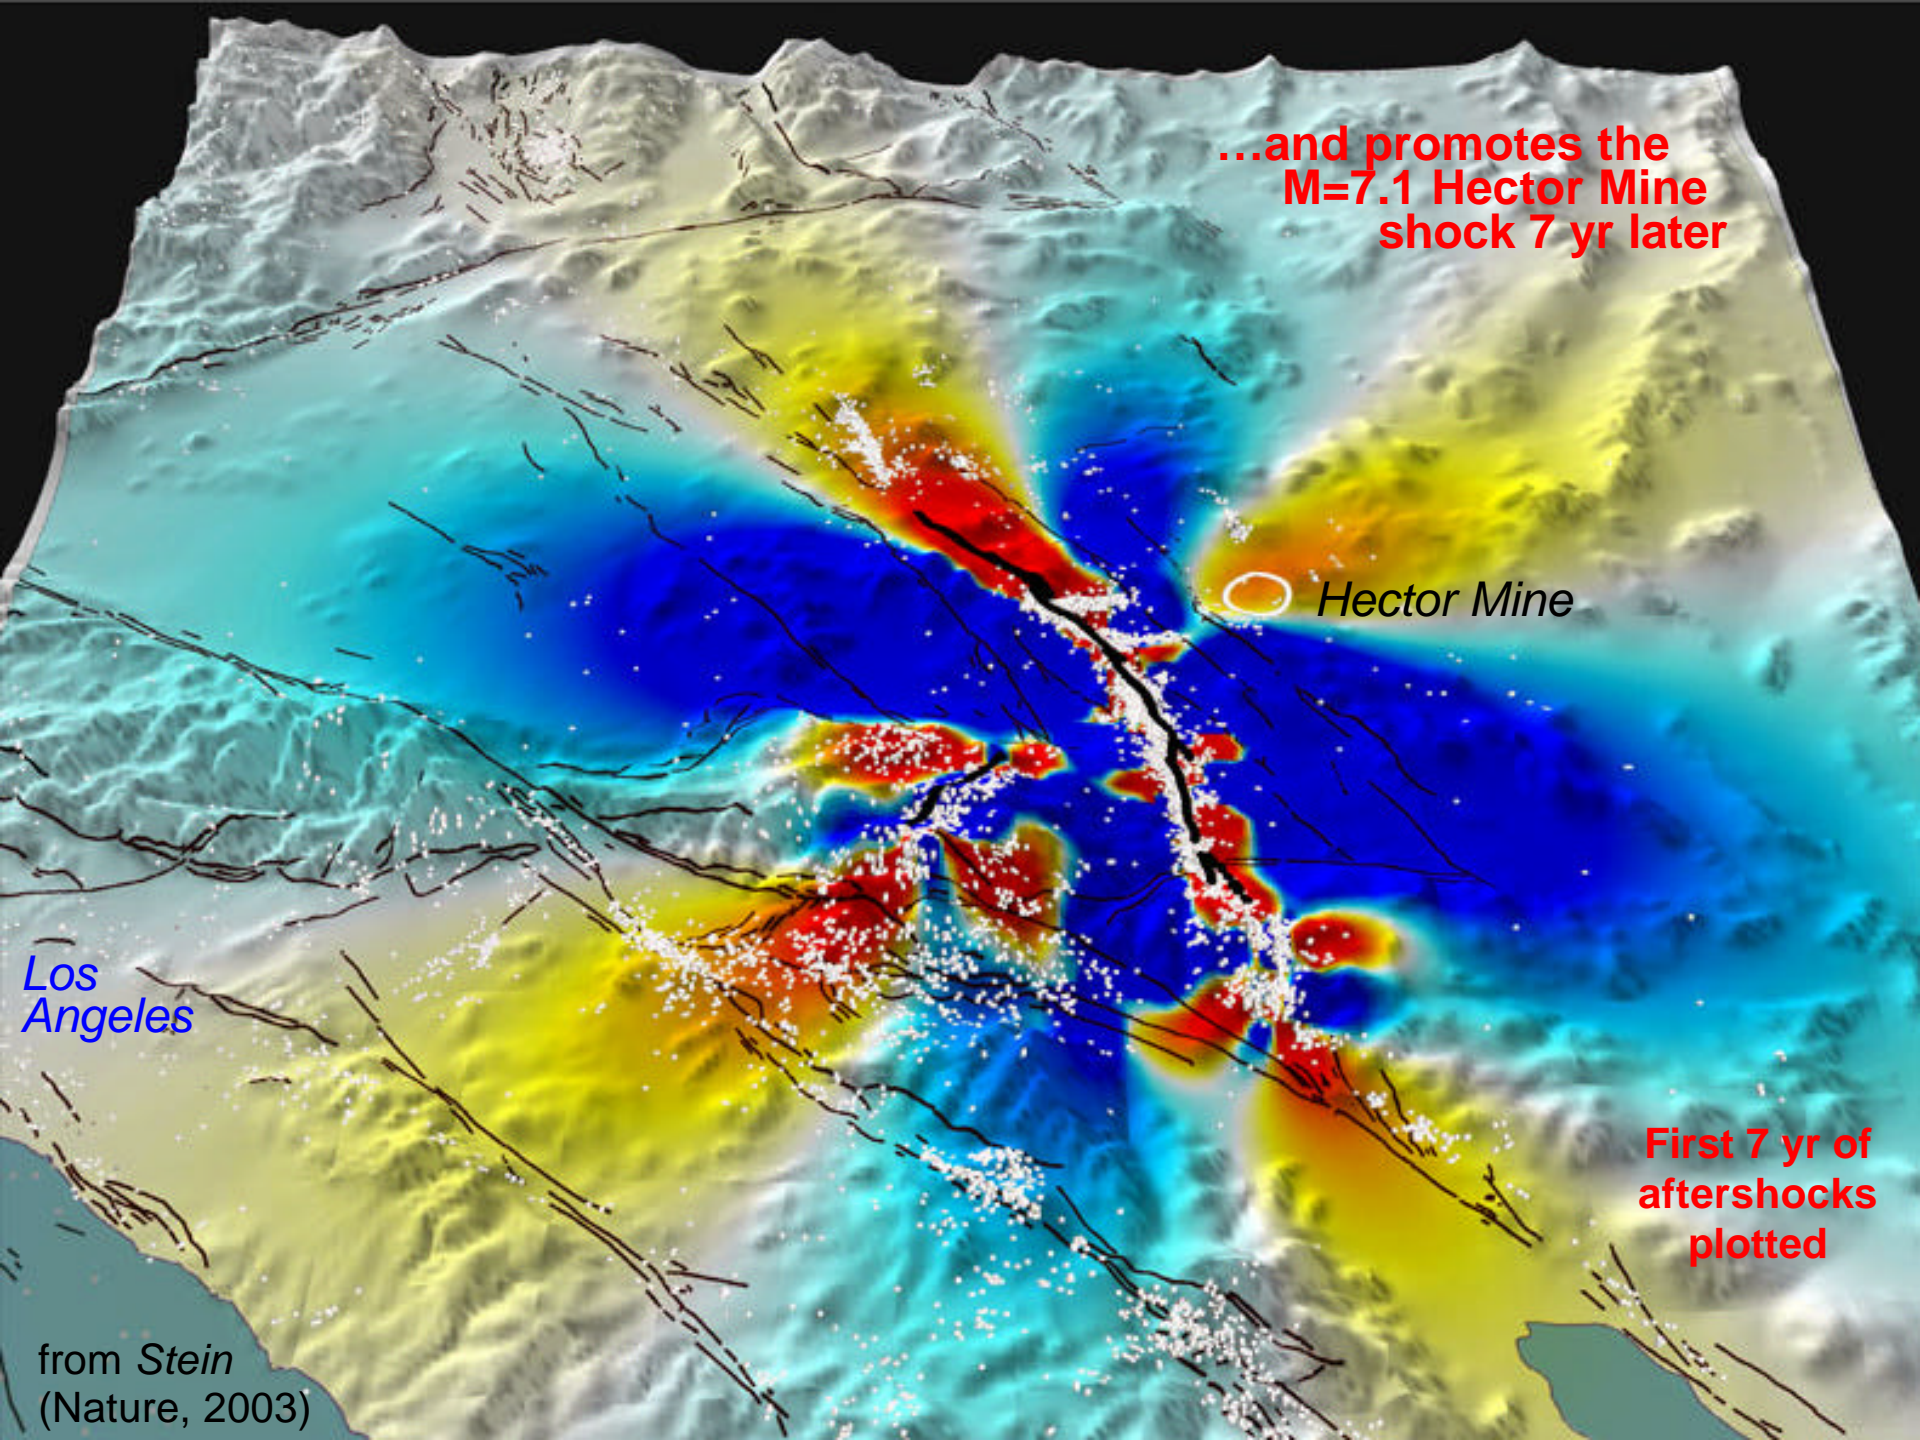

Landers

Big Bear

Los Angeles

aftershocks
plotted

from Stein
(Nature, 2003)

It appears the Sumatra M 9.3(?) earthquake on December 26, 2004 triggered the M 8.7 earthquake on March 28, 2005.

Seismic Wave Propagation

P

S

The wave *speed* depends on the *resistance* of the material to being compressed or sheared

- S wave speed depends on *rigidity*, the resistance to shear
 - Fluids (like air or water) have *no* rigidity.
- P wave speed depends on both *rigidity* and *incompressibility*, the resistance to being compressed
 - P waves travel faster than S waves

The Human Wave
